

This year it is more important that you protect your children and loved ones FROM the "FLU VACCINES" than the actual influenza itself. Here are the reasons:

1. This flu is simply another flu. It is not unusually deadly. In fact, the H1N1 swine flu in circulation is less deadly than many other influenza outbreaks. The first 1000 confirmed swine flu cases in Japan and China produced zero deaths. The Centres for Disease Control alleges 36,000 Americans succumb to the flu each year, but so far, since March through August of 2009 (6 months), the swine flu has been attributed to ~500-600 deaths in the US. The swine flu of 2009 has already swept through the Southern Hemisphere's flu season without alarm. Only exaggerated reports have been issued by the World Health Organization regarding hospitalizations required during the flu season in South American countries. Getting exposed to influenza and developing natural antibodies confers resistance for future flu outbreaks. Artificially boosting antibodies by exposure to flu viruses in vaccines is more problematic than natural exposure. The Western world has been exposed to the H1N1 swine flu throughout the summer of 2009 with far fewer deaths and hospitalizations than commonly attributed to the seasonal flu.

2. Health authorities tacitly admit prior flu vaccination programs were of worthless value. This is the first time both season and pandemic flu vaccines will be administered. Both seasonal flu and swine flu vaccines will require two inoculations. This is because single inoculations have failed to produce sufficient antibodies. Very young children and older frail adults, the high-risk groups in the population, may not produce sufficient antibodies in response to the flu vaccine. This is an admission that prior flu vaccines were virtually useless. The same people who brought you the ineffective vaccines in past years are bringing you this year's new vaccines. Can you trust them this time?

3. In addition to failure to produce sufficient antibodies, this swine flu vaccine is brought to you by the same people who haven't been able to adequately produce a seasonal flu vaccine that matches the flu strain in circulation. In recent years flu vaccination has been totally worthless because the strains of the flu in circulation did not match the strain of the virus in the vaccines. Authorities claim the prevalent flu strain in circulation in mid-September '09 is the H1N1 swine flu, which appears to be milder than past seasonal influenza in circulation. If this data is correct, why receive the season flu shot this year? In Britain, 50% plus of Medical Staff and nurses are refusing to take any flu vaccines because they haven't been tested and are aware of their inefficacy. (<http://www.dailymail.co.uk/news/article-1208716/Half-GPs-refuse-swine-flu-vaccine-testing-fears.html>)

4. The vaccines will be produced by no less than four different manufacturers, possibly with different additives (called adjuvants) and manufacturing methods. The two flu inoculations may be derived from a multi-dose vial and in a crisis, and in short supply, it will be

diluted to provide more doses and then adjuvants must be added to trigger a stronger immune response. Adjuvants are added to vaccines to boost production of antibodies but may trigger auto immune reactions. Some adjuvants are mercury (thimerosal), aluminium and squalene all of which can prove fatal. Would you permit your children to be injected with lead? Lead is very harmful to the brain. Then why would you sign a consent form for your kids to be injected with mercury, which is even more brain-toxic than lead? Injecting mercury may fry the brains of your children and is linked to autism, Lou Gehrig's, Cancer, Guillain-Barré syndrome, etc

5. This is the first year mock vaccines have been used to gain FDA approval. Mock vaccines are made to gain approval of the manufacturing method and then the prevalent virus strain in circulation is added just days before it is actually placed into use. Don't subject your children to experimental vaccines. Yes, these vaccines have been tested on healthy kids and adults, but they are not the same vaccines your children will be given. Those children with asthma, allergies, type I diabetes, etc. are at greater risk for side effects. Children below the age of 2 years do not have a sufficient blood-brain barrier developed and are subject to chronic brain infections that emanate into symptoms that are called autism. Toddlers should not be subjected to injected viruses.

6. Over-vaccination is a common practice now in the West. Some Western children are subjected to 29 vaccines by the age of two. This means a little bit of disease is being injected into young children continually during their most formative years and don't forget they are getting these toxins with every dose! Veterinarians have backed off of repeat vaccination in dogs because of observed side effects so what should this tell us about our children.

7. Health officials want to vaccinate women during pregnancy, subjecting the fetal brain to an intentional biological assault. A recent study showed exposure flu viruses among women during pregnancy provoke a similar gene expression pattern in the fetus as that seen in autistic children. This is a tacit admission that vaccines, which inject a little bit of influenza into humans, causes autism.

8. Modern medicine has no explanation for autism, despite its continued rise in prevalence. Yet autism is not reported among Amish children who go unvaccinated. Beware the falsehoods of modern medicine.

9. School kids are likely to receive nasally-administered vaccines (Flu-Mist) that require no needle injection. But this form of live vaccine produces viral shedding which will surely be transmitted to family members. What a way to start an epidemic!

10. This triple re assortment virus appears to be man made. The H1N1 swine flu virus of 2009 coincidentally appeared in Mexico on the same week that President Nicolas Sarkozy of France visited Mexican

president Felipe Calderon, to announce that France intends to build a multi-million dollar vaccine plant in Mexico. An article written by Ron Maloney of the Seguin, Texas Gazette-Enterprise newspaper announces a "rehearsal for a pandemic disaster" scheduled for May 2, 2009. The article says: "Guadalupe County emergency management and their counterparts around the country are preparing for just such a scenario..." This means county health authorities across the US had been preparing a rehearsal for mass vaccinations prior to the announced outbreak in Mexico. Virologists admit this part swine flu/part avian flu/part human flu virus must have taken time to develop. But it somehow wasn't detected by hundreds of flu monitoring stations across the globe. On April 24, 2009 Dr. John Carlo, Dallas County Medical Director, alludes that the H1N1 strain of the Swine flu as possibly being engineered in a laboratory. He says: "This strain of swine influenza that's been cultured in a laboratory is something that's not been seen anywhere actually in the United States and the world, so this is actually a new strain of influenza that's been identified." (Globe & Mail, Canada) Others have suggested the virus was deliberately sent airborne over the Mexican state and breathed in starting the "so-called" epidemic, this being called "Chemtrails"(see Google)

11. Recall the swine flu scare of 1976. In a politically charged atmosphere where Gerald Ford was seeking election to the Presidency, the swine flu suddenly appeared at a military base. Vaccine was produced and millions of Americans were vaccinated. But the vaccine was worse than the disease, causing hundreds of cases of Guillain Barre syndrome and a few deaths. In a replay of the past, the White House is directly involved in promoting the H1N1 2009 swine flu vaccine. The federal government will use federal funds to pay off schools to administer vaccines, promote vaccination via highway billboards and TV advertisements, and conduct military-style mass inoculations in such rapid fashion that if side effects occur, it will be too late. The masses will have been vaccinated already. Over \$9 billion has been allotted by the federal government to develop and deliver an unproven and experimental flu vaccine. Don't be a guinea pig for the government.

12. Researchers are warning that over-use of the flu vaccine and anti-flu drugs like Tamiflu and Relenza can apply genetic pressure on flu viruses and then they are more likely to mutate into a more deadly strain. Health authorities want 70% of the public to be vaccinated against the flu this '09 season, which is more than double the vaccination percentage of any prior flu season. This would certainly apply greater genetic pressure for the flu to mutate into a more virulent strain.

13. Most seasonal influenza A (H1N1) virus strains tested from the United States and other countries are now resistant to Tamiflu (oseltamivir). Tamiflu has become a nearly worthless drug against seasonal flu. According to data provided by the Centres for Disease Control, among 1148 seasonal flu samples tested, 1143 (99.6%)
